Bug 1: Incorrect HTTP Method Handling on Home Route

Description:

The home route was configured to process user input using a GET request without proper request handling separation.

Impact:

When the home route was restricted to the POST method, accessing the page via a browser GET request resulted in a 405 Method Not Allowed error, preventing the application from loading and displaying existing notes.

Resolution:

The issue was resolved by redirecting the user after processing the query parameter, ensuring that the request is not reprocessed on page reload.

Bug 2: Missing Input Validation in the User Interface

Description:

The text input field in home.html did not enforce mandatory input.

Impact:

Users were able to submit empty notes, resulting in invalid and blank entries in the notes list.

Resolution:

Client-side validation was added using the required attribute to prevent empty submissions.

Bug 3: Duplicate Note Creation on Page Refresh

Description:

Submitted notes were appended multiple times when the browser page was refreshed.

Root Cause:

The application relied on query parameters for form submission, which are re-executed on browser refresh.

Resolution:

A redirect was implemented after processing the input to clear query parameters and prevent duplicate note insertion.
